

Build a Streamlit web app in Python on Replit called “30-Day Credit Plan Generator”.

Goal:

User uploads a client credit report PDF (MyFreeScoreNow). The app extracts the text, finds negative items, and generates a formatted PDF “30 Day Student CREDIT ANALYSIS” plan using my existing template structure.

MUST MATCH THIS TEMPLATE STRUCTURE:

- Header area: “CLIENT CREDIT ANALYSIS”
 - Client Name
 - Credit Report Date
- Section 1: CREDIT OVERVIEW
 - Current Credit Scores (Experian, Equifax, TransUnion)
- Section 2: NEGATIVE ACCOUNTS FOUND / NEGATIVE ACCOUNTS IDENTIFIED
 - List accounts found (Account name, last 4 of account number if available, Issue type)
- Section 3: DISPUTE STRATEGY
 - Disputes submitted to Experian/Equifax/TransUnion
 - Challenge basis: Accuracy, Completeness, Reporting compliance, Consumer protection laws
 - Timeline: 30–35 days (or 30–45 days as shown in template)
- Section 4: EXPECTED OUTCOMES
 - Accounts deleted, balances reduced, late payments removed, accounts updated, inquiries deleted
 - Note: multiple rounds required
- “30 Day Student CREDIT ANALYSIS” action plan:
 - Round 1 letter section + the Skool link for Round 1 letter
 - 7 day deletion method section + Skool link
 - Round 2 section + Skool link
 - Late payments section + Skool link
 - Student loan late payments section + Skool link
 - Investigation timeline note
 - Credit building resources section with:
 - Kovo \$10/mo link
 - Ava \$9/mo link
 - Bonus note about linking debit card

STATIC LINKS TO INCLUDE (hardcode them exactly):

- Round 1 letter Skool link:

<https://www.skool.com/rosefinanceacademy/classroom/3a86de80?md=3bb0c48048a94417bee271ec5f99bb21>

- 7 day deletion method Skool link:

<https://www.skool.com/rosefinanceacademy/classroom/3a86de80?md=6740a676535846689642e3f0bc9485a3>

- Round 2 Skool link:

<https://www.skool.com/rosefinanceacademy/classroom/3a86de80?md=2b47934c79b74458b0c8f30396deb22f>

- Late payments Skool link:

<https://www.skool.com/rosefinanceacademy/classroom/3a86de80?md=34c7865c1b3e4500a95a9664b3fb1c70>

- Student loan late payments link:

<https://www.skool.com/rosefinanceacademy/student-loan-relief-late-payment-edition?p=e42ed538>

- Kovo link:

<https://kovo-credit.sjv.io/XYNNOX>

- Ava link:

<https://meetava.sjv.io/rose>

INPUTS (Streamlit UI):

- Client Name (text)
- Credit Report Date (date picker OR text)
- Upload credit report PDF (MyFreeScoreNow)
- Optional: Coach Notes (text area)
- Checkbox: "I confirm I have client consent to process this report"
- Button: "Generate PDF Plan"

PDF TEXT EXTRACTION:

- Use pdfplumber + pypdf to extract text.
- If extracted text is too short (<500 chars) show error: "This PDF may be image-based; OCR is required." (Do not implement OCR in v1.)
- Provide an expander to show the first 10,000 characters of extracted text for troubleshooting.

PARSING / LOGIC (v1):

- Detect and list potential negative items by scanning extracted text for keywords:
 - Late Payment (30/60/90 day late, delinquent)
 - Collection
 - Charge-off
 - Inquiry / Hard Inquiry
- Create a table in the PDF under "NEGATIVE ACCOUNTS IDENTIFIED" with columns:
 - Account
 - Account Number (mask, keep last 4 if detected; otherwise blank)
 - Issue
- Count totals for: late payments, collections, charge-offs, inquiries (optional display).

PDF OUTPUT:

- Generate a clean, branded PDF (not plain text) using reportlab.
- Use bold headers, spacing, and bullet points.
- Name file: {CLIENT_NAME}_30_day_credit_plan.pdf
- Provide a Streamlit download button.

FILES TO CREATE:

- app.py
- requirements.txt

requirements.txt MUST include:

streamlit
pypdf
pdfplumber
reportlab

Make the code readable with comments and easy for a beginner to edit.

Enhancement:

Add simple routing rules:

- If issue contains "Collection", mark as "Collection - 7 day method" in the table.
- If issue contains "Late", mark as "Late Payment".
- If issue contains "Inquiry", mark as "Inquiry".

Also include a mini summary near the top:

"Found: X late payments, Y collections, Z inquiries".

Upgrade my 30-Day Credit Plan Generator to use a rule-based expert system that reflects how a professional credit consultant analyzes reports.

Instead of just detecting keywords, add logic that determines:

1. PRIORITY ORDER:

- Collections and charge-offs come first because they impact utilization and score heavily.
- Late payments are next priority.
- Inquiries are lowest priority unless excessive.

2. DISPUTE STRATEGY INTELLIGENCE:

Automatically decide:

- When to recommend Round 1 bureau disputes.
- When to recommend a 7-day deletion method.
- When to escalate to Round 2 disputes.
- When credit building should start immediately instead of waiting.

3. CLIENT COACHING TONE:

Generate guidance in a coaching tone, not robotic:

- Encourage consistency.
- Remind clients results take multiple rounds.
- Reinforce financial responsibility habits.

4. ACTIONABLE PLAN:

Output must include:

- EXACT next steps for first 7 days.
- What NOT to do during disputes.
- Credit-building recommendations.

This should feel like a human expert wrote the plan.

Add professional credit repair industry intelligence to my tool:

Analysis should include:

- Credit utilization strategy:
If balances appear high, recommend lowering to under 30%, ideally 1–9%.
- Payment history strategy:
Emphasize on-time payments immediately if late payments detected.
- Inquiry management:
Only dispute inquiries if they appear unauthorized or excessive.
- Credit building:
Suggest secured cards, credit builders, or tradelines if thin profile.
- Multiple rounds expectation:
Always explain disputes may take 2–3 rounds.

Output should educate clients, not just instruct them.

Improve PDF output quality:

1. Make the plan read like a professional credit consultant report.

2. Include:

- Summary diagnosis section
- Action plan timeline
- Credit-building recommendations
- Motivation / accountability note

3. Formatting:

- Section headers bold

- Clean spacing
- Professional tone
- Easy for client to follow

Make it something I could confidently send paying clients.

Add a customizable framework module.

Create a section in the code where I can edit:

- My dispute philosophy
- My credit building recommendations
- My preferred dispute order
- My client education messaging

These settings should control how the plan is generated so I can adjust strategy without rewriting code.

Add an AI reasoning layer:

Instead of only keyword detection, analyze extracted report text holistically.

Generate:

- Diagnosis summary
- Priority scoring of negative items
- Risk factors affecting approval odds
- Personalized 30-day roadmap

The output should sound like an experienced credit strategist.

Improve client experience:

Add:

- Encouragement messaging
- Accountability reminders
- "What to expect next" section
- Realistic timeline explanation

Make clients feel guided, not overwhelmed.

Make the app business-ready:

Add:

- Client name watermark on PDF

- Date stamp
- Confidential footer
- Disclaimer section
- Optional branding header (Rose Finance Academy)

Ensure no credit report data is stored permanently.
